What Makes Interior-Gen Different

Real, verified differentiators - researched against the actual AI interior-design competitor landscape, not generic marketing claims.

Researched September 2026

The claims below were checked against real, current write-ups of the AI interior-design market (RoomGPT, Interior AI, Collov AI, Spacely AI, Remodel AI, HomeDesignsAI, Renovate AI, MyRoomDesigner.AI, and dedicated AI floor-plan tools such as Mimarix, CADdillo and AI Cadbull Studio) before being written as differentiators - not assumed.

1. Three real budget tiers from one photo, one generation

Every competitor sells tiers as "pay more, get more generations or styles." None of them give you the SAME room redesigned at three actual renovation budget levels - Economical, Mid-Range, Premium - side by side, in one pass. That is a different pitch: "see what your actual room costs to fix cheap, moderate, or luxury," not "here is one AI-generated vibe."

2. Materials pricing that is real, itemized, and locally sourced

Competitors that do have a cost feature (Renovate AI, MyRoomDesigner.AI) show a generic price range or a shoppable-catalog total. Interior-Gen runs a dedicated real web search per line item (flooring, paint, lighting, ceiling, feature wall, decor), converts to the buyer's local currency for their actual city, and shows the real source link - flagging anything it could not verify as an estimate rather than pretending it is real.

3. Structure preservation that actually holds

This is the single most common complaint about the two most-recommended tools, RoomGPT and Interior AI: users report walls moving, windows hallucinated, doorways added, a TV turned into a window - the AI "restyles" into a room that no longer matches theirs. Interior-Gen is built specifically to prevent that (locked camera angle, locked wall/window/door positions, tuned fidelity settings).

> **Honest caveat**
>
> HomeDesignsAI and Interior AI also now CLAIM exact wall/window preservation. Frame this as "we get this right where it visibly breaks for others," not "we invented it."

4. "Build a House" is a different category than "AI exterior redesign"

Every competitor's "exterior" feature redesigns the paint or facade of a house that already exists in a photo. Interior-Gen's Build a House starts from a VACANT PLOT plus real stated dimensions and produces an actual new-construction concept - architecturally a different problem, and none of the interior-design competitors researched do it.

5. A real, exportable AutoCAD file - computed by math, not guessed by a model

Dedicated AI floor-plan tools exist (Mimarix, CADdillo, AI Cadbull) and claim "exact coordinates," but text-to-CAD/diffusion-based generators have a well-known failure mode: hallucinated dimension text and

broken geometry. Interior-Gen's floor plan is 100% deterministic geometry - computed directly from the stated plot dimensions, not asked of an AI - then exported as a real .dxf that opens correctly in actual AutoCAD, wall thickness and door/window openings included.

6. A feasibility check before anything is generated

If someone asks for 5 bedrooms, 3 bathrooms, and a garage on a plot too small to fit them, Interior-Gen calculates real minimum room areas plus circulation space and says so upfront - "not feasible" or "tight fit," with the actual numbers - instead of silently cramming rooms into an impossible layout. No competitor researched does this kind of pre-generation reality check.

7. Architectural common sense baked into the layout

Ensuite bathrooms are automatically placed next to their OWN bedroom, a real hallway connects private rooms instead of doors opening bedroom-to-bedroom, the garage is buffered from living space through a proper entry, and the front door lands on whichever compass edge actually faces the road. This is rules-based architectural logic, not a single AI guess.

8. Transparent about what is accurate vs. concept art

Interior-Gen shows two floor-plan cards side by side and labels them honestly: the deterministic one ("Computed Layout") is dimensionally accurate; the AI-stylized one ("Concept Layout") is explicitly marked "not a precise blueprint." Most AI floor-plan tools imply everything they output is equally reliable - this one does not.
